

jhaAddress Verify™

Verify Addresses - as they are entered or in batch

Would you like a labor-saving method of automatically checking for valid postal addresses?

BUSINESS VALUE

- Enhance Service
- Save Money
- Improve Operations

COMPATIBILITY

- Episys®

Symitar's jhaAddress Verify™ is a hosted core-integrated near real-time solution that helps avoid the time, expense, and trouble created by incorrect addresses.

IT WORKS LIKE THIS ...

jhaAddress Verify provides address validation, standardization, and enforces updates at point-of-entry in Episys®. Addresses are automatically checked against the US Postal Service database, and address fields are populated with just a few keystrokes. Addresses can also be displayed on Google Maps™.

Because of this product's Episys integration, a Verify Address screen can automatically launch when credit union employees enter or update address fields in the system. The standalone version of jhaAddress Verify can be launched from a dropdown box within Teller Transactions or Account Manager.

The product integrates and operates with Symitar's Enhanced Member Application™, Enhanced Loan Application™, and Enhanced Account Revision™.

BATCH FEATURES

jhaAddress Verify has batch capabilities that enables it to extract and standardize addresses and automatically exclude known bad addresses.

The returned file from Centurion updates and standardizes addresses found in the US Postal Service database and updates addresses with corrections and standardizations. Addresses not found are displayed on an Address Verification Review/Update screen with useful error codes to assist with correcting those addresses not found. Addresses with error codes are automatically updated with an account level note, an account level bad address warning code and, if the credit union chooses, a No Mail statement mail code. The same screen offers access to other addresses associated with the name record.

WHAT IT DOES:

- Verifies and corrects postal addresses by matching them against the current US Postal Service database as they are entered
- Displays addresses on Google Maps
- Provides batch address cleansing and displays addresses not found
- Provides additional periodic cleansing using USPS CASS software
- Automatically adds notes or codes for bad addresses

WHAT IT DOES FOR YOU:

- Speeds point-of-entry address verification
- Reduces the time and expense of processing returned mail
- Increases member service by ensuring correct delivery
- Helps reduce fraud and postal costs
- Keeps your address database current

Get the benefits of faster workflow, address accuracy, and reduced postal error expenses - jhaAddress Verify.
